

Lingua Cards-language Flashcard System Presentation

Created by: Lidya Ghede

Date: 07/23/2025

Overview

What is Lingua Cards?

- Lingua Cards is a console-based flashcard app to help study language vocabulary through self-paced learning. It is built in C++ and uses a text file to store flash cards persistently between sessions.

User can:

- Add new flash cards (word + translation)
- Review Flash cards by testing their memory of translations. (if it answers correctly, it updates their progress)
- View progress stats like total numbers, how many have been “ mastered ” (answer correctly 3+ times)

Why it works: based on the learning principle that repeated exposure spaced over time improves memory retention. The system encourages reviewing cards just before you are likely to forget them.

01

Program Data & Key Feature

- Front: the words to remember
 - Back: its translation the words
 - Correct Count: how many user got it right
 - Last review: last time it was reviewed.
-
- This code explain that the internal structure and logic of the Lingua Cards Flash cards program.
 - I use a class to organize the logic and data of the flash cards system. This keeps the code clean and modular.

02

```
10 // Flashcard structure representing each flashcard's data
11 struct Flashcard {
12     std::string front;           // The word/question
13     std::string back;           // The translation/answer
14     int correctCount;          // Number of times answered correctly
15     time_t lastReview;         // Last review timestamp
16 };
```

```
// LinguaCards class: handles flashcard management and review
class LinguaCards {
private:
    std::vector<Flashcard> cards;    // List of flashcards
    const std::string filename = "flashcards.txt"; // File to store cards
```

```

void loadCards() {
    std::ifstream file(filename);
    if (!file.is_open()) return; // if file doesn't exist, skip

    std::string front, back;
    int count;
    time_t last;

    // Read each card's data: front, back, correctCount, lastReview
    while (std::getline(file, front) && std::getline(file, back) && file >> count >> last) {
        file.ignore(); // Clear newline
        cards.push_back({front, back, count, last});
    }
    file.close();
}

// Saves current flashcards to file pon exit or update
void saveCards() {
    std::ofstream file(filename);
    for (const auto& card : cards) {
        file << card.front << "\n"
            << card.back << "\n"
            << card.correctCount << " "
            << card.lastReview << "\n";
    }
    file.close();
}

// Add a new flashcard to the list
void addCard(const std::string& front, const std::string& back) {
    cards.push_back({front, back, 0, time(nullptr)});
    saveCards();
}

```

Saving and Loading Flash cards.

- To keep the flashCards between program runs, we read and write them to a file.
- The loadCards: this function opens the file, read data line by line and loads flashcards into memory .
- The SaveCrads: the function write all flashcards data to the file so progress is saved.
- The AddCard:: method let user add new words and their translations. It add the card to memory, sets review count to 0 and current time, saves the new card to file.

On this feature it choose cards that the user needs to review.

- It selects cards that: Are not mastered yet (less than 3 correct answer) or have not been reviewed in 24 hours.
- It also asks user to type the answer. If correct, increase Correct Count, updates times. If wrong, reduces Correct Count also update review times. After reviewing all cards, saves progress.

```
if (answer == card.back) {  
    std::cout << "Correct!\n";  
    // Update the original card in the list  
    for (auto& c : cards) {  
        if (c.front == card.front) {  
            c.correctCount++;  
            c.lastReview = time(nullptr);  
        }  
    }  
} else {  
    std::cout << "Incorrect. Answer: " << card.back << "\n";  
    // Penalize and update last review time  
    for (auto& c : cards) {  
        if (c.front == card.front) {  
            c.correctCount = std::max(0, c.correctCount - 1);  
            c.lastReview = time(nullptr);  
        }  
    }  
}  
  
saveCards(); // Save updates after reviewing
```

```
// Review flashcards using spaced repetition logic  
void reviewCards() {  
    if (cards.empty()) {  
        std::cout << "No flashcards available. Add some first!\n";  
        return;  
    }  
  
    std::vector<Flashcard> dueCards;  
    time_t now = time(nullptr);  
    // Select cards that are either not mastered or due after 1 day  
    for (const auto& card : cards) {  
        // Simple spaced repetition: review if not answered correctly 3 times or 1 day has passed  
        if (card.correctCount < 3 || difftime(now, card.lastReview) >= 86400) {  
            dueCards.push_back(card);  
        }  
    }  
  
    if (dueCards.empty()) {  
        std::cout << "No cards due for review!\n";  
        return;  
    }  
  
    // Shuffle cards randomly for varied practice  
    std::random_shuffle(dueCards.begin(), dueCards.end());  
    // Review each due card  
    for (auto& card : dueCards) {  
        std::cout << "Front: " << card.front << "\nEnter answer: ";  
        std::string answer;  
        std::getline(std::cin, answer);  
    }  
}
```

Progress Statistics

This method shows the total and mastered cards.

- A mastered card is one the user got correct 3 times.
- It helps user see progress and improvement.

```
/ Display flashcard statistics to the user
void showStats() {
    if (cards.empty()) {
        std::cout << "No cards available.\n";
        return;
    }

    int total = cards.size();
    int mastered = 0;
    // Count cards mastered (answer correctly 3+ times)
    for (const auto& card : cards) {
        if (card.correctCount >= 3) mastered++;
    }

    std::cout << "Total cards: " << total << "\n";
    std::cout << "Mastered cards: " << mastered << "(" << (mastered * 100 / total) << "%)\n";
}
```

Main function - THE APP RUNNER

```
/ Main function: entry point for the application
int main() {
    LinguaCards app;
    std::string choice;
    // Menu loop
    while (true) {
        std::cout << "\nLinguaCards Menu:\n"
            << "1. Add flashcard\n"
            << "2. Review flashcards\n"
            << "3. Show stats\n"
            << "4. Exit\n"
            << "Choose an option: ";
        std::getline(std::cin, choice);

        if (choice == "1") {
            std::string front, back;
            std::cout << "Enter front (word): ";
            std::getline(std::cin, front);
            std::cout << "Enter back (translation): ";
            std::getline(std::cin, back);
            app.addCard(front, back);
            std::cout << "Card added!\n";
        } else if (choice == "2") {
            app.reviewCards();
        } else if (choice == "3") {
            app.showStats();
        } else if (choice == "4") {
            break; // Exist the program
        } else {
            std::cout << "Invalid option. Try again.\n";
        }
    }

    return 0;
}
```

- It displays a menu to the user repeatedly until they choose to exit.
- Calls the corresponding method based on user input. It also keeps the interface clean and user - friendly.

Linux C++ Example

I used `g++ -std=c++11 main.cpp -o main` to compile my program with modern C++ features and give it a custom name. It ensures my flashcard app works correctly with newer language tools.

This is the GNU C++ compiler it compiles your C++ source code `.cpp` into a program your computer can run.

```
LinguaCards Menu:  
1. Add flashcard  
2. Review flashcards  
3. Show stats  
4. Exit  
Choose an option: 1  
Enter front (word): egg  
Enter back (translation): huevo  
Card added!
```

```
LinguaCards Menu:  
1. Add flashcard  
2. Review flashcards  
3. Show stats  
4. Exit  
Choose an option: 1  
Enter front (word): how are you?  
Enter back (translation): Cómo estás  
Card added!
```

```
LinguaCards Menu:  
1. Add flashcard  
2. Review flashcards  
3. Show stats  
4. Exit  
Choose an option: goodnight  
Invalid option. Try again.
```

```
LinguaCards Menu:  
1. Add flashcard  
2. Review flashcards  
3. Show stats  
4. Exit  
Choose an option: 1  
Enter front (word): goodnight  
Enter back (translation): buenas noches  
Card added!
```

```
LinguaCards Menu:  
1. Add flashcard  
2. Review flashcards  
3. Show stats  
4. Exit  
Choose an option: 2  
Front: egg  
Enter answer: huevo  
Incorrect. Answer: œuf  
Front: goodnight  
Enter answer: buenas noches  
Correct!  
Front: how are you?  
Enter answer: Cómo estás  
Correct!  
Front: egg  
Enter answer: huevo  
Correct!
```

```
LinguaCards Menu:  
1. Add flashcard  
2. Review flashcards  
3. Show stats  
4. Exit  
Choose an option: 3  
Total cards: 4  
Mastered cards: 0 (0%)
```

```
LinguaCards Menu:  
1. Add flashcard  
2. Review flashcards  
3. Show stats  
4. Exit  
Choose an option: 4  
lidyaghdede@Mac Project % █
```

The program starts by showing a menu with 4 options: Add FlashCard, Review FlashCards, Show stats and Exit. If the user chooses option 1 (Add FlashCards) and words like e.g. "egg" -> "huevo" or "how are you" -> "cómo estás" or "goodnight" -> "buenas noches". When an invalid input like "goodnight" was entered instead of a number, the program correctly handled it by saying "invalid option. Try again." The user chooses option 2 (Review flashcards) and practices by typing the translation; the program will mark the answer as correct or incorrect based on the user's input. Finally, by choosing option 3, the user sees stats like: "Total cards: 4", "Mastered cards: 0(0%)". Exiting the program using option 4 ends the session.

Graphical User Interface

```
+-----+
| Front (word): [ egg      ]
| Back (translation): [ œuf     ]
|
| [ Add Flashcard ]
| [ Review Flashcard ]
| [ Show Stats ]
|
| Output: "Flashcard added!"
+-----+
```

This project can be enhanced with a Graphical User Interface (GUI) using the Qt framework for C++. The GUI would replace the text-based menu with input fields and buttons to make the program more user-friendly.

The GUI would include: A text box to enter the flashcard front (e.g., the English word), A text box to enter the back (e.g., the translation), A button to add a flashcard, A button to review flashcards, A button to show statistics, A display area showing system messages (e.g., “Correct!”, or “Flashcard added!”)

Conclusion

In this project, I developed Lingua Cards, a flash cards based language learning tool written in C++. It allows users to:

- Add new vocabulary words and translations, Review FlashCards, view performance statistics.
- I used modular programming techniques with a custom FlashCards struct and a Lingua Cards class to organize the code. The program was compiled using G++ -std=c++11 to ensure compatibility with modern C++ features.
- The key skills applied: file handling, object oriented programming, and input validation and menu systems.
- I learned how to design a simple, interactive console application that mimics real-world education tools.
- This project helped reinforce concepts in C++ and improved my ability to build user focused programs.

Thank you!
